JM EAGLE TO CARRY NEW ELECTRICAL SPACERS

JM Eagle brings new and improved electrical spacers to its vast line of electrical products.

Replacing spacers previously sold by the company, the new JM Eagle spacers are lighter, stronger and easier to handle, and are being sold from coast to coast. The new spacers slide together vertically and horizontally for fast, secure field assembly, and the vertical slide connection allows for multiple-diameter pipe sizes side by side in the duct bank.

Suitable for completely enclosed and locked-in duct banks, the spacers may

be used in encased-burial and direct-burial applications. The spacers feature wide base bottoms offering support to duct banks, support holes that allow base spacers to be secured to the trench floor, and a stronger, lighter-weight design for easier use.

“JM Eagle customers will find that these new spacers provide a much less labor intensive installation than previous offerings,” says Michael Lang, JM Eagle’s electrical fitting manager. “We are excited to count these spacers among the high-quality products in JM Eagle’s Electrical Fittings line.”
